Executive Summary

Project Name Game Dev Agent

Project URL https://www.gamedevagent.ai/

Overview GamedevAgent introduces a specialized ERC20

token, AIDEV, aimed at the game development

community. It leverages advanced Solidity features for efficient token management, including minting, burning, and transfers with enhanced security measures. A unique aspect is its integration with Permit2 for infinite allowance, simplifying token spending processes and improving user experience

in DeFi transactions.

Audit Scope The scope of this Audit was to analyze the Game

Dev Agent Token Smart Contracts for quality,

security, and correctness.

Contracts in Scope https://basescan.org/token/

Review 1 31st January 2025

Number of Issues per Severity

Severity

| | High | Medium | Low | Informational |
|--------------------|------|--------|-----|---------------|
| Open | 0 | 0 | 0 | 0 |
| Resolved | 0 | 0 | 0 | 0 |
| Acknowledged | 0 | 0 | 0 | 0 |
| Partially Resolved | 0 | 0 | 0 | 0 |

SALIAS

Checked Vulnerabilities

Access Management

Arbitrary write to storage

Centralization of control

Ether theft

✓ Improper or missing events

Logical issues and flaws

Arithmetic ComputationsCorrectness

✓ Race conditions/front running

✓ SWC Registry

✓ Re-entrancy

✓ Timestamp Dependence

✓ Gas Limit and Loops

Exception Disorder

Gasless Send

Use of tx.origin

Malicious libraries

✓ Compiler version not fixed

Address hardcoded

Divide before multiply

✓ Integer overflow/underflow

✓ ERC's conformance

✓ Dangerous strict equalities

✓ Tautology or contradiction

Return values of low-level calls

Checked Vulnerabilities

Missing Zero Address Validation

✓ Private modifier

✓ Revert/require functions

Multiple Sends

Using suicide

✓ Using delegatecall

Upgradeable safety

Using throw

Using inline assembly

✓ Style guide violation

✓ Unsafe type inference

✓ Implicit visibility level

Techniques and Methods

Throughout the audit of smart contracts, care was taken to ensure:

- The overall quality of code
- Use of best practices
- · Code documentation and comments, match logic and expected behavior
- Token distribution and calculations are as per the intended behavior mentioned in the whitepaper
- Implementation of ERC standards
- · Efficient use of gas
- Code is safe from re-entrancy and other vulnerabilities

The following techniques, methods, and tools were used to review all the smart contracts:

Structural Analysis

In this step, we have analyzed the design patterns and structure of smart contracts. A thorough check was done to ensure the smart contract is structured in a way that will not result in future problems.

Static Analysis

A static Analysis of Smart Contracts was done to identify contract vulnerabilities. In this step, a series of automated tools are used to test the security of smart contracts.

Techniques and Methods

Code Review / Manual Analysis

Manual Analysis or review of code was done to identify new vulnerabilities or verify the vulnerabilities found during the static analysis. Contracts were completely manually analyzed, their logic was checked and compared with the one described in the whitepaper. Besides, the results of the automated analysis were manually verified.

Gas Consumption

In this step, we have checked the behavior of smart contracts in production. Checks were done to know how much gas gets consumed and the possibilities of optimization of code to reduce gas consumption.

Tools and Platforms Used for Audit

Remix IDE, Foundry, Solhint, Mythril, Slither, Solidity Statistic Analysis.

Types of Severity

Every issue in this report has been assigned to a severity level. There are four levels of severity, and each of them has been explained below.

High Severity Issues

A high severity issue or vulnerability means that your smart contract can be exploited. Issues on this level are critical to the smart contract's performance or functionality, and we recommend these issues be fixed before moving to a live environment.

Medium Severity Issues

The issues marked as medium severity usually arise because of errors and deficiencies in the smart contract code. Issues on this level could potentially bring problems, and they should still be fixed.

Low Severity Issues

Low-level severity issues can cause minor impact and are just warnings that can remain unfixed for now. It would be better to fix these issues at some point in the future.

Informational

These are four severity issues that indicate an improvement request, a general question, a cosmetic or documentation error, or a request for information. There is low-to-no impact.

Types of Issues

Open

Security vulnerabilities identified that must be resolved and are currently unresolved.

Acknowledged

Vulnerabilities which have been acknowledged but are yet to be resolved.

Resolved

These are the issues identified in the initial audit and have been successfully fixed.

Partially Resolved

Considerable efforts have been invested to reduce the risk/impact of the security issue, but are not completely resolved.

High Severity Issues

No Issues Found.

Medium Severity Issues

No Issues Found.

Low Severity Issues

No Issues Found.

Informational Issues

No Issues Found.

Closing Summary

In this report, we have considered the security of Game Dev Agent Token Contract. We performed our audit according to the procedure described above.

Code Looks Good, No Issues Found.

Disclaimer

QuillAudits Smart contract security audit provides services to help identify and mitigate potential security risks in Game Dev Agent Token Contract. However, it is important to understand that no security audit can guarantee complete protection against all possible security threats. QuillAudits audit reports are based on the information provided to us at the time of the audit, and we cannot guarantee the accuracy or completeness of this information. Additionally, the security landscape is constantly evolving, and new security threats may emerge after the audit has been completed.

Therefore, it is recommended that multiple audits and bug bounty programs be conducted to ensure the ongoing security of Game Dev Agent Token Contract. One audit is not enough to guarantee complete protection against all possible security threats. It is important to implement proper risk management strategies and stay vigilant in monitoring your smart contracts for potential security risks.

QuillAudits cannot be held liable for any security breaches or losses that may occur subsequent to and despite using our audit services. It is the responsibility of Game Dev Agent Team to implement the recommendations provided in our audit reports and to take appropriate steps to mitigate potential security risks.

About QuillAudits

QuillAudits is a leading name in Web3 security, offering top-notch solutions to safeguard projects across DeFi, GameFi, NFT gaming, and all blockchain layers. With six years of expertise, we've secured over 1000 projects globally, averting over \$30 billion in losses. Our specialists rigorously audit smart contracts and ensure DApp safety on major platforms like Ethereum, BSC, Arbitrum, Algorand, Tron, Polygon, Polkadot, Fantom, NEAR, Solana, and others, guaranteeing your project's security with cutting-edge practices.
